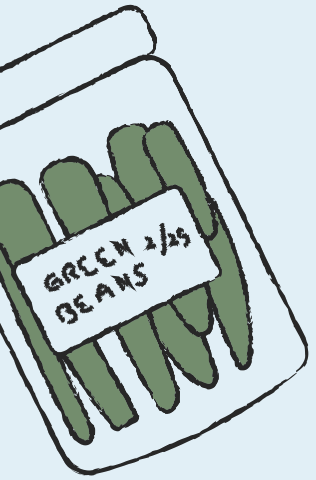
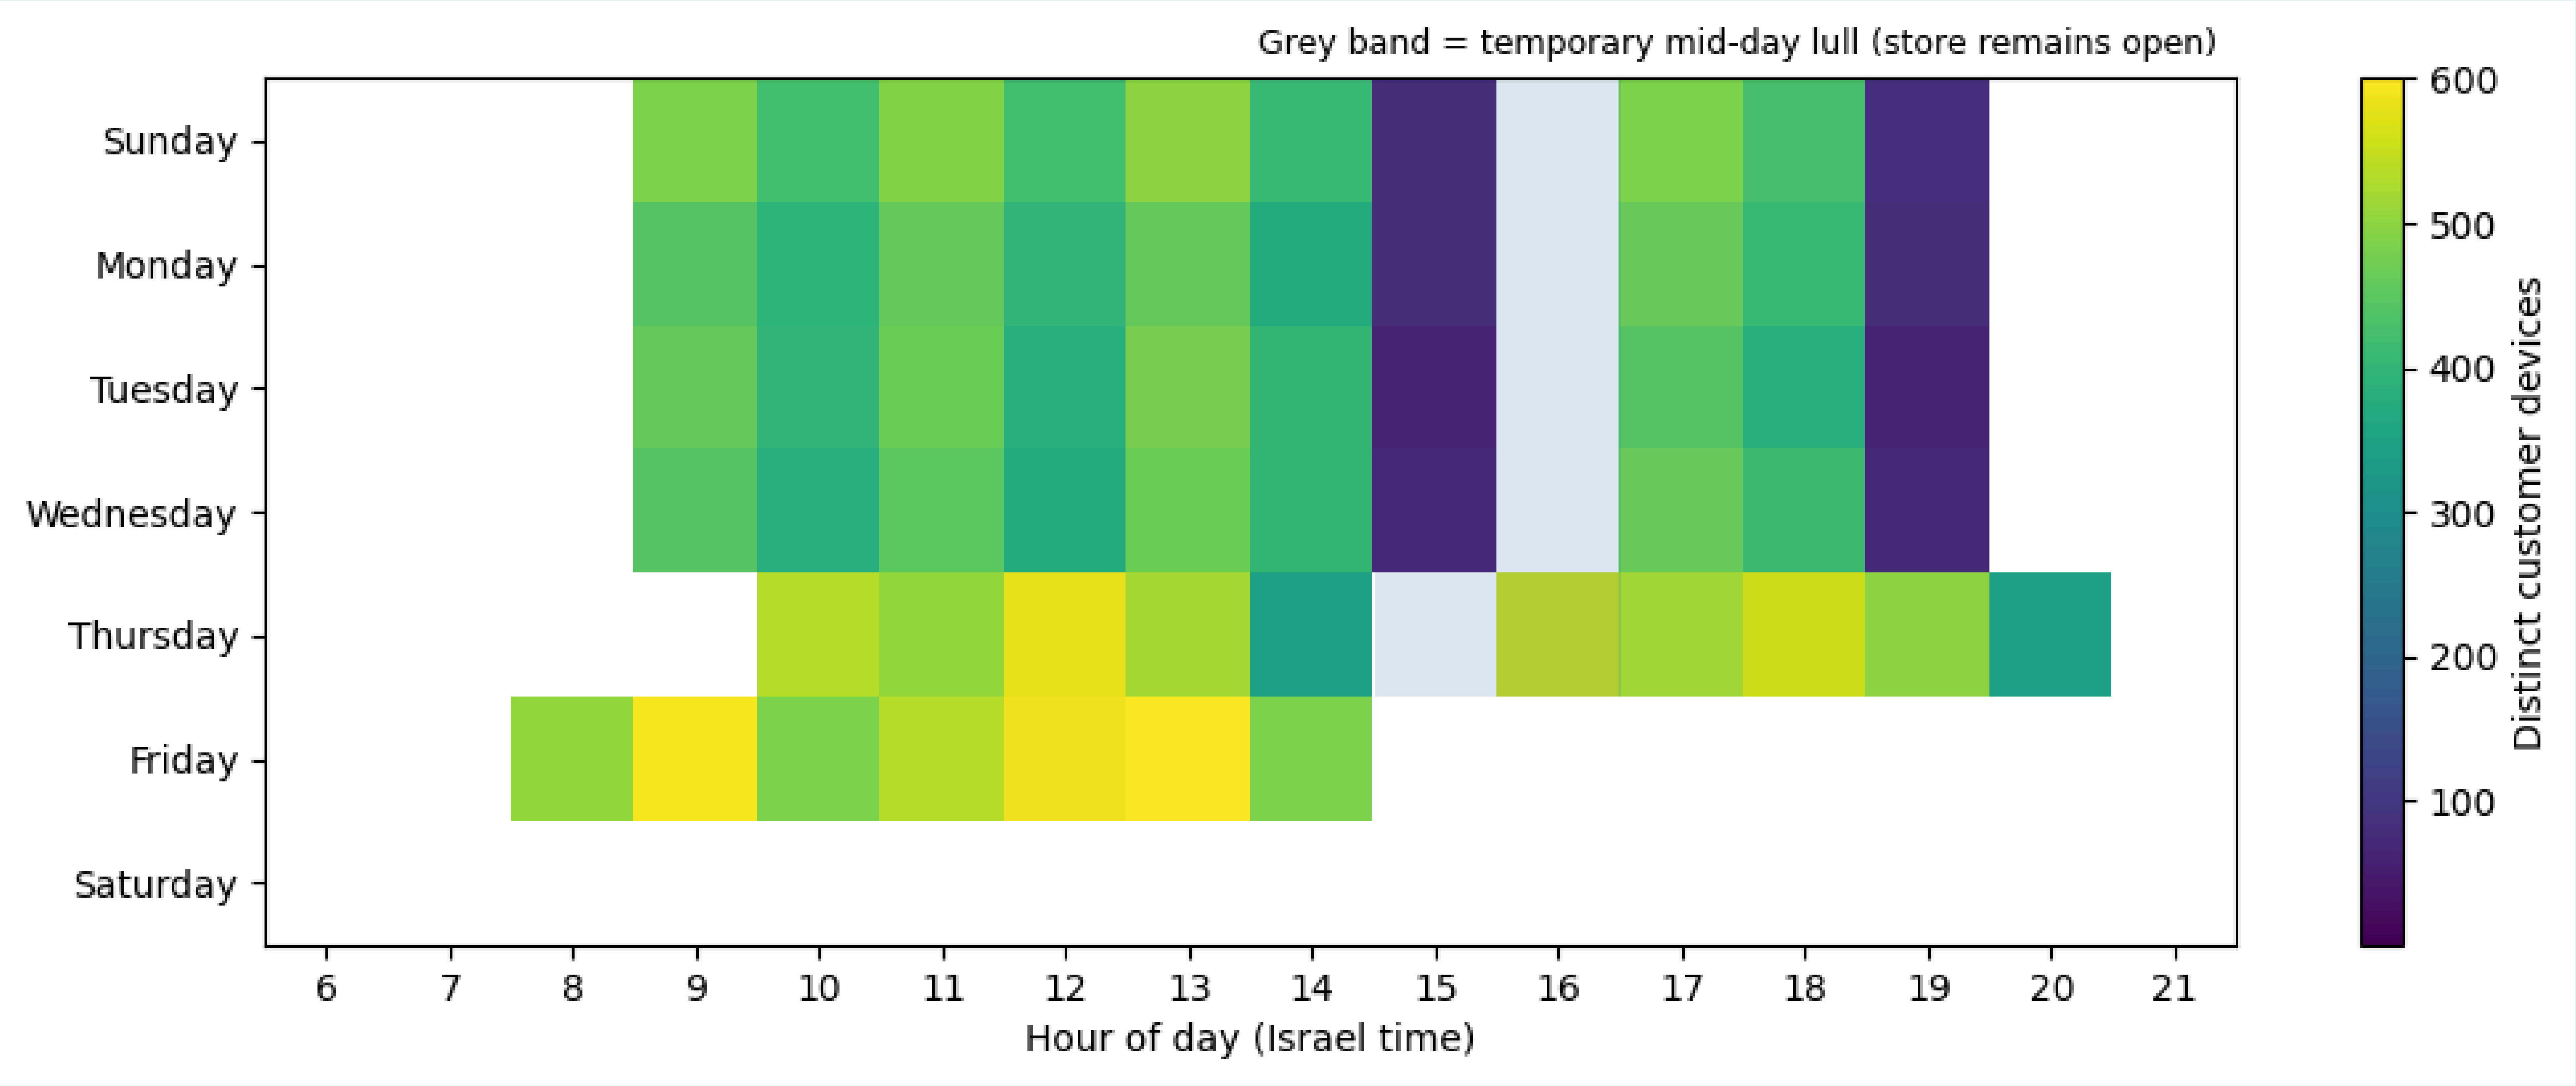
Aron Harkham

Methodology: From raw data into decisions

1. Data validation (coverage, duplicates, nulls)
2. Data quality: location accuracy thresholding (≤30m logic)
3. Segmentation: customers, employees, non-app customers
4. Demand metrics (hour × weekday, weekly trends)
5. Operational metrics: checkout load & staffing
6. Regression: dwell time vs. basket size



When do customers actually show up?



Operating Window:

Most traffic: 09:00–14:00 and 16:00–19:00

Peak Days:

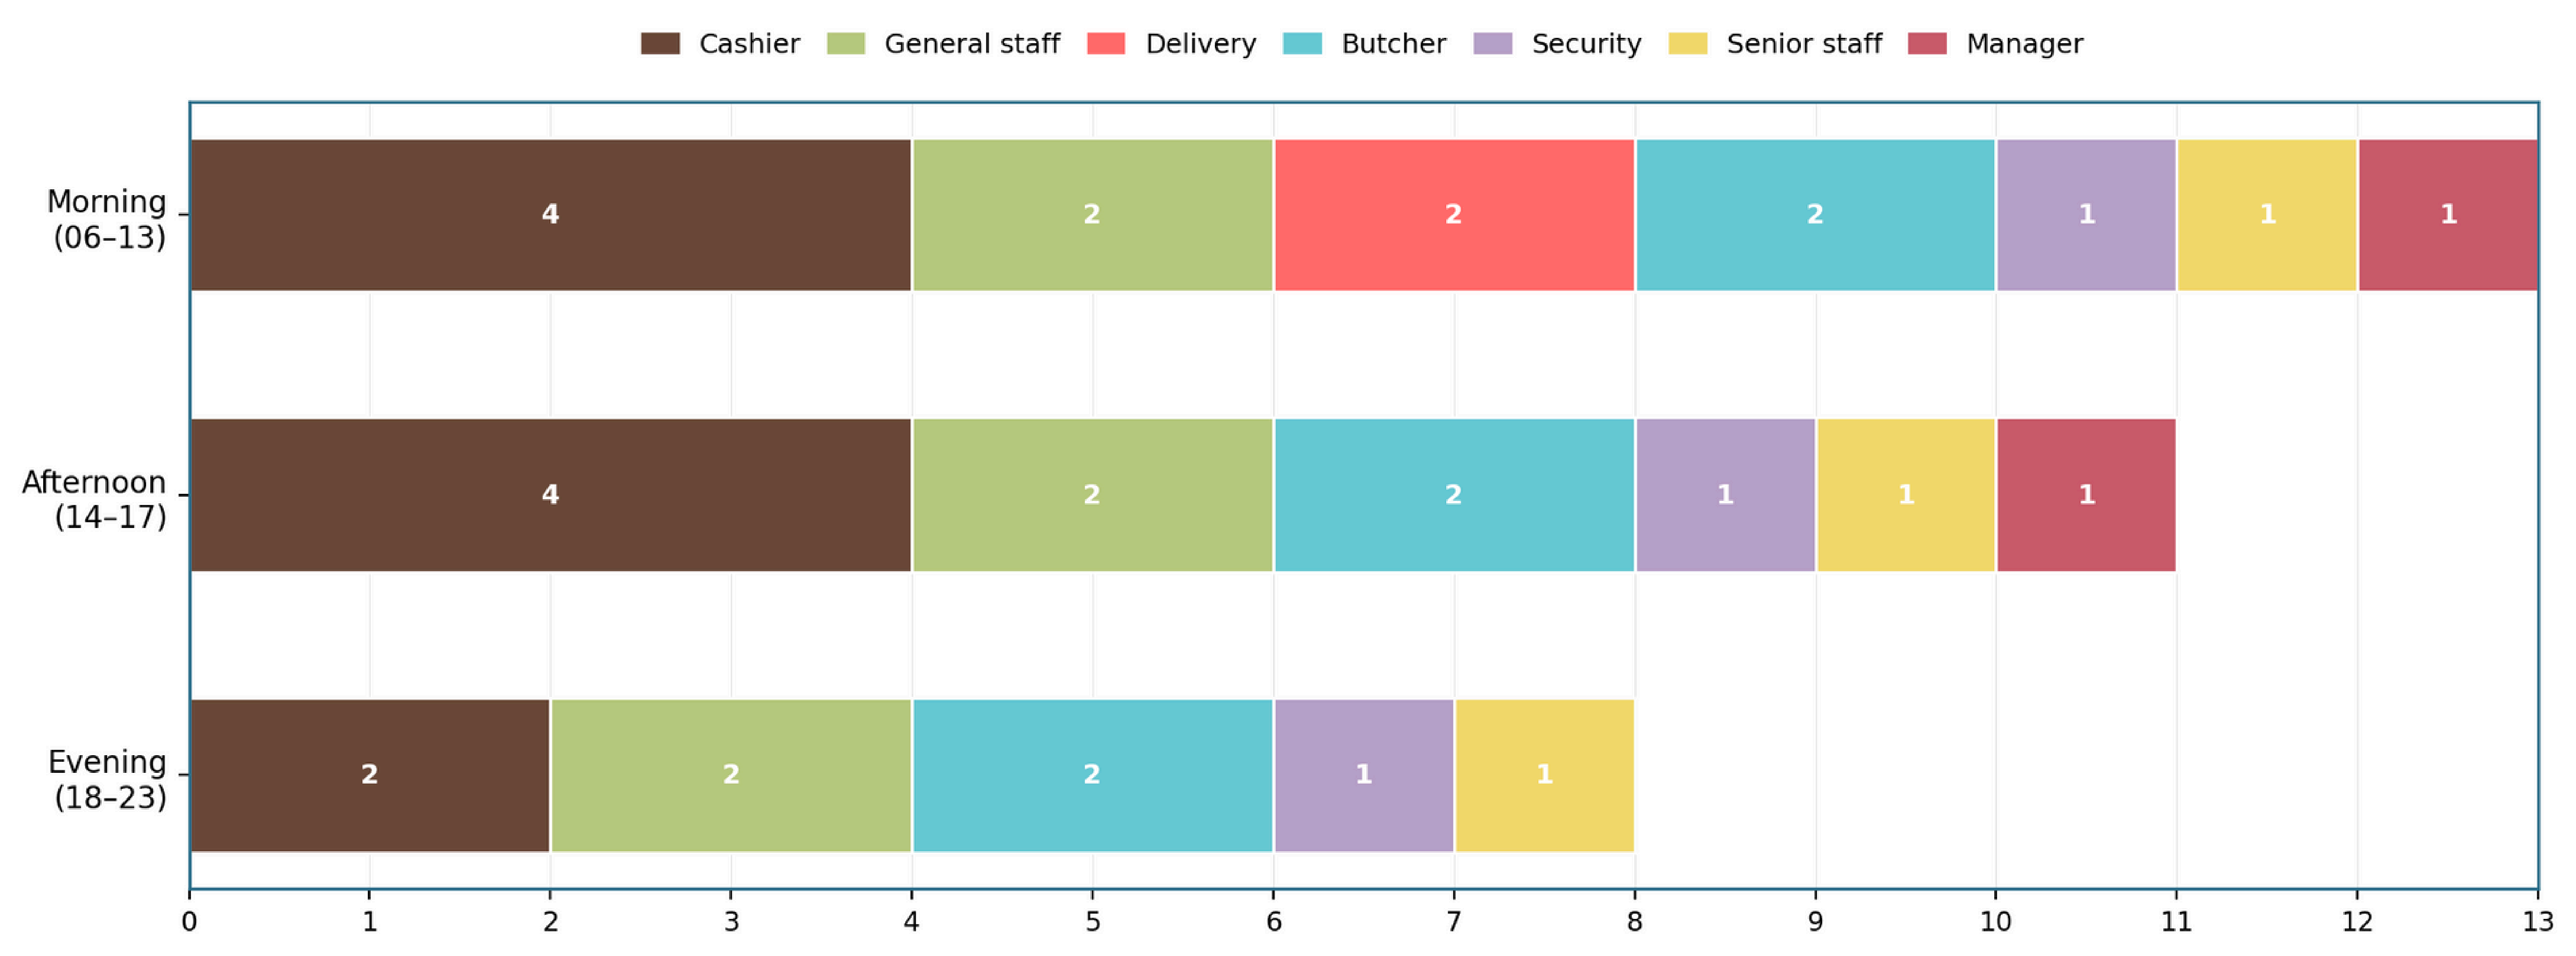
Peaks cluster on Thursday–Friday

Action:

Align Staffing + self-checkout to these windows

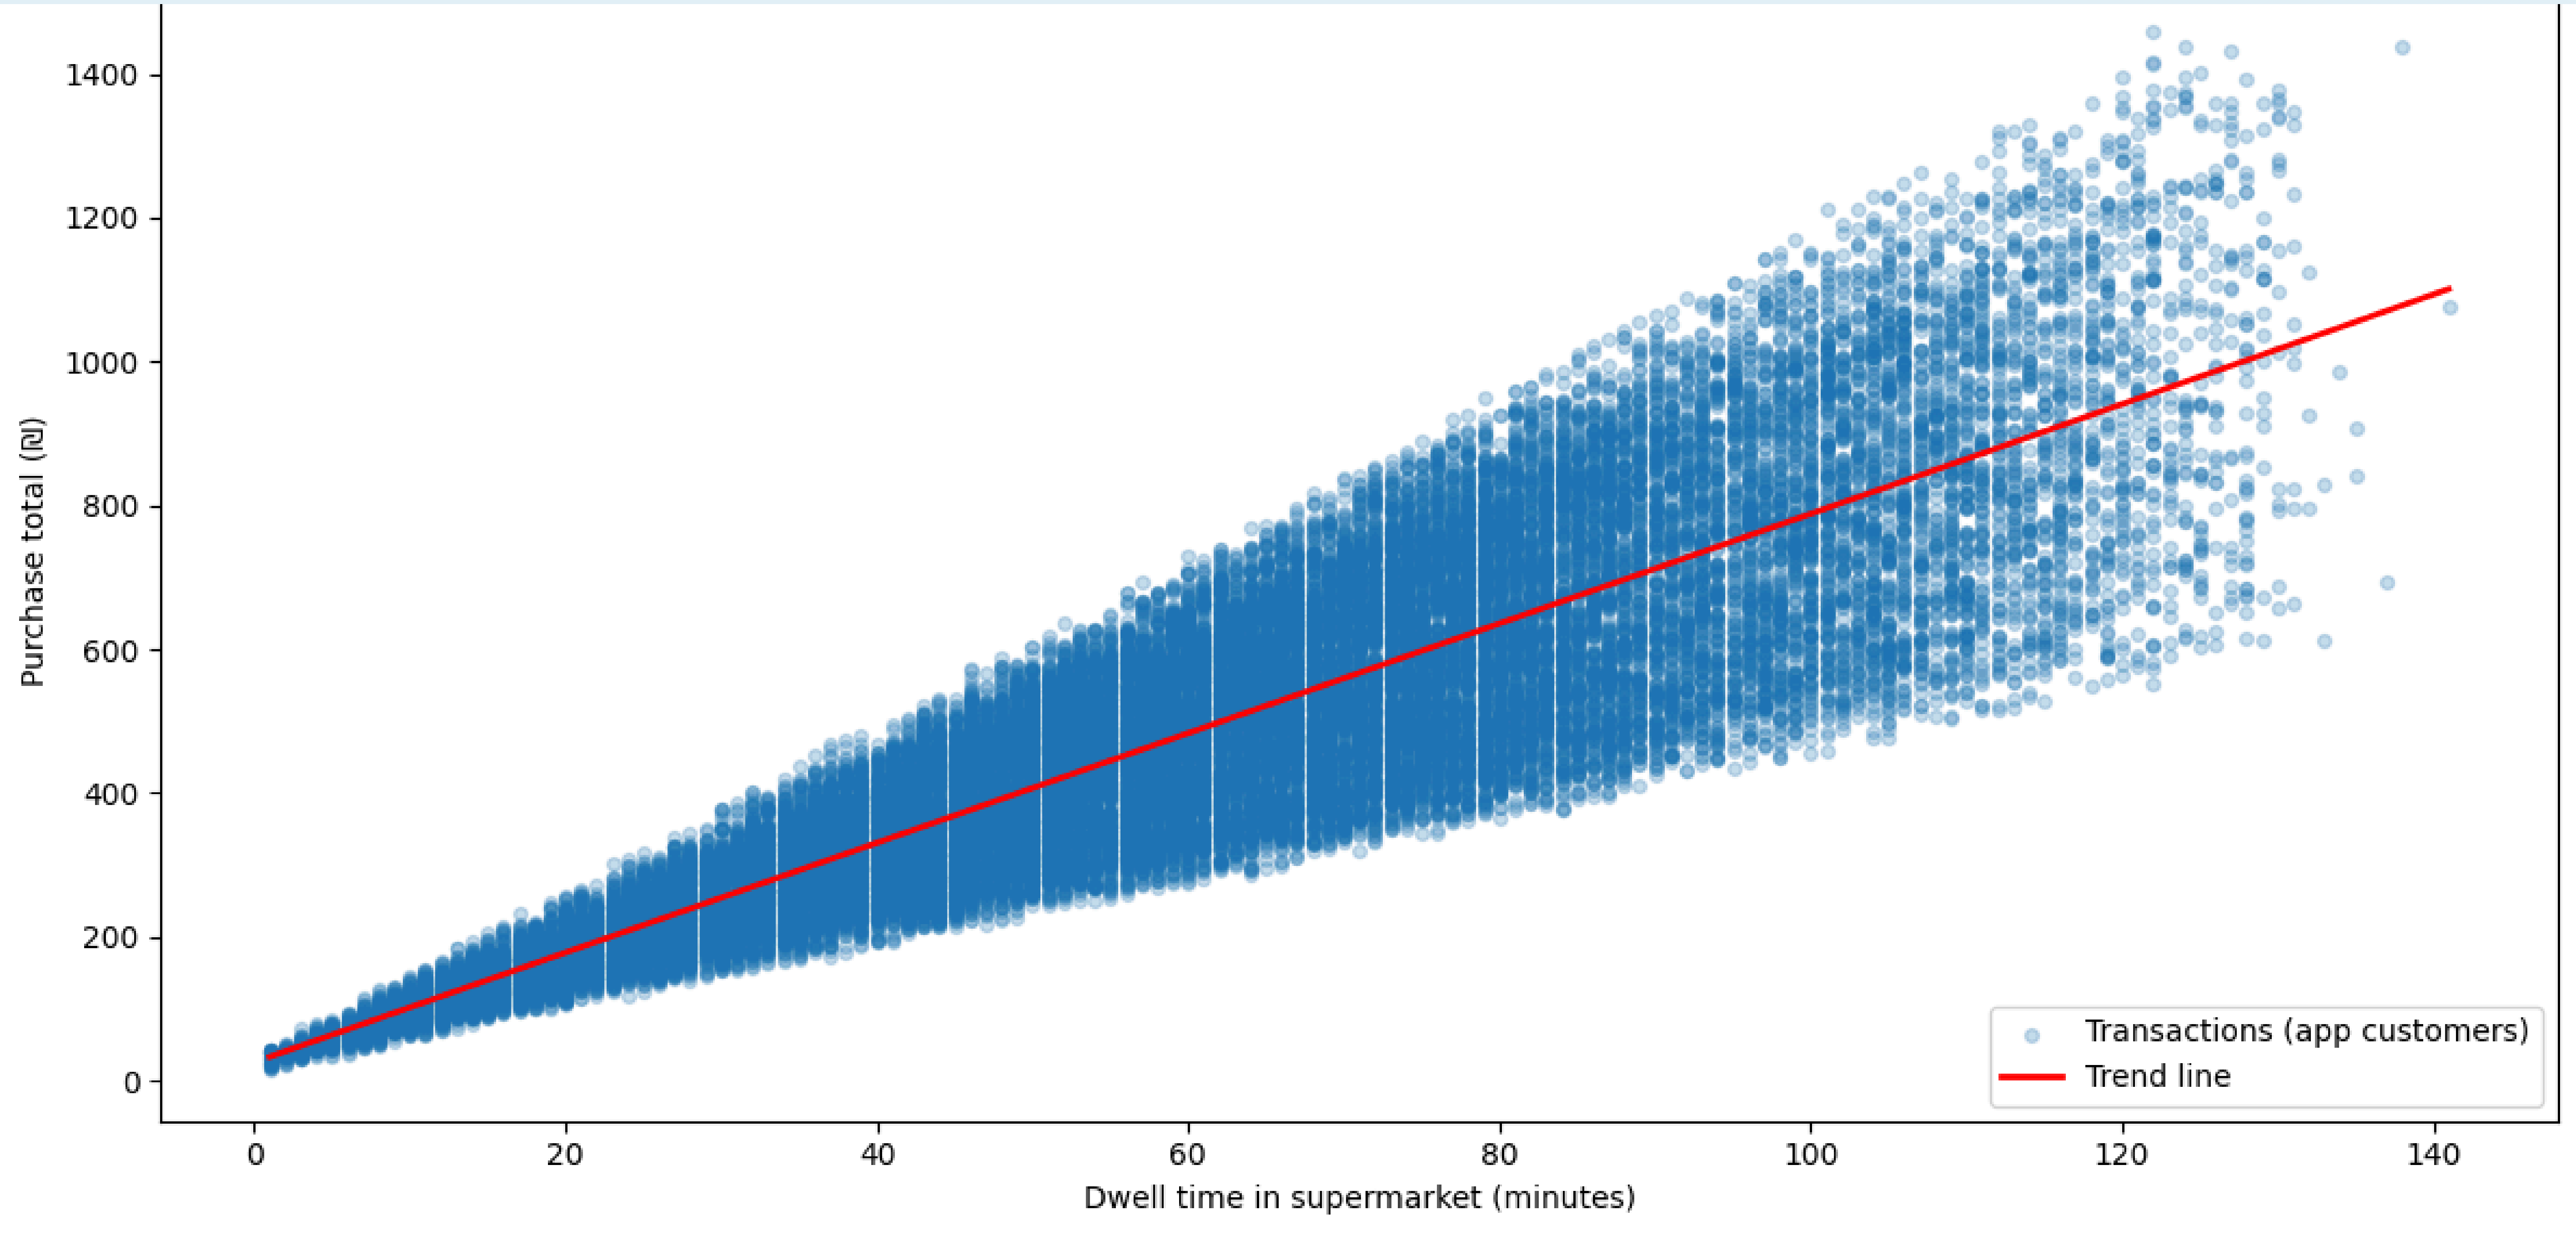
Staffing by shift (who's on the floor, when)

Distinct employee devices by shift (Jun–Nov 2025)



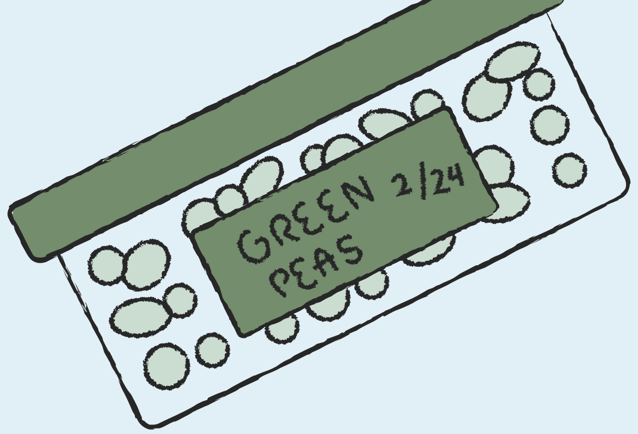
- Morning (06–13) = highest staffing
- Afternoon (14–17) = strong but leaner
- Evening (18–23) = **lowest coverage → align with demand peaks**

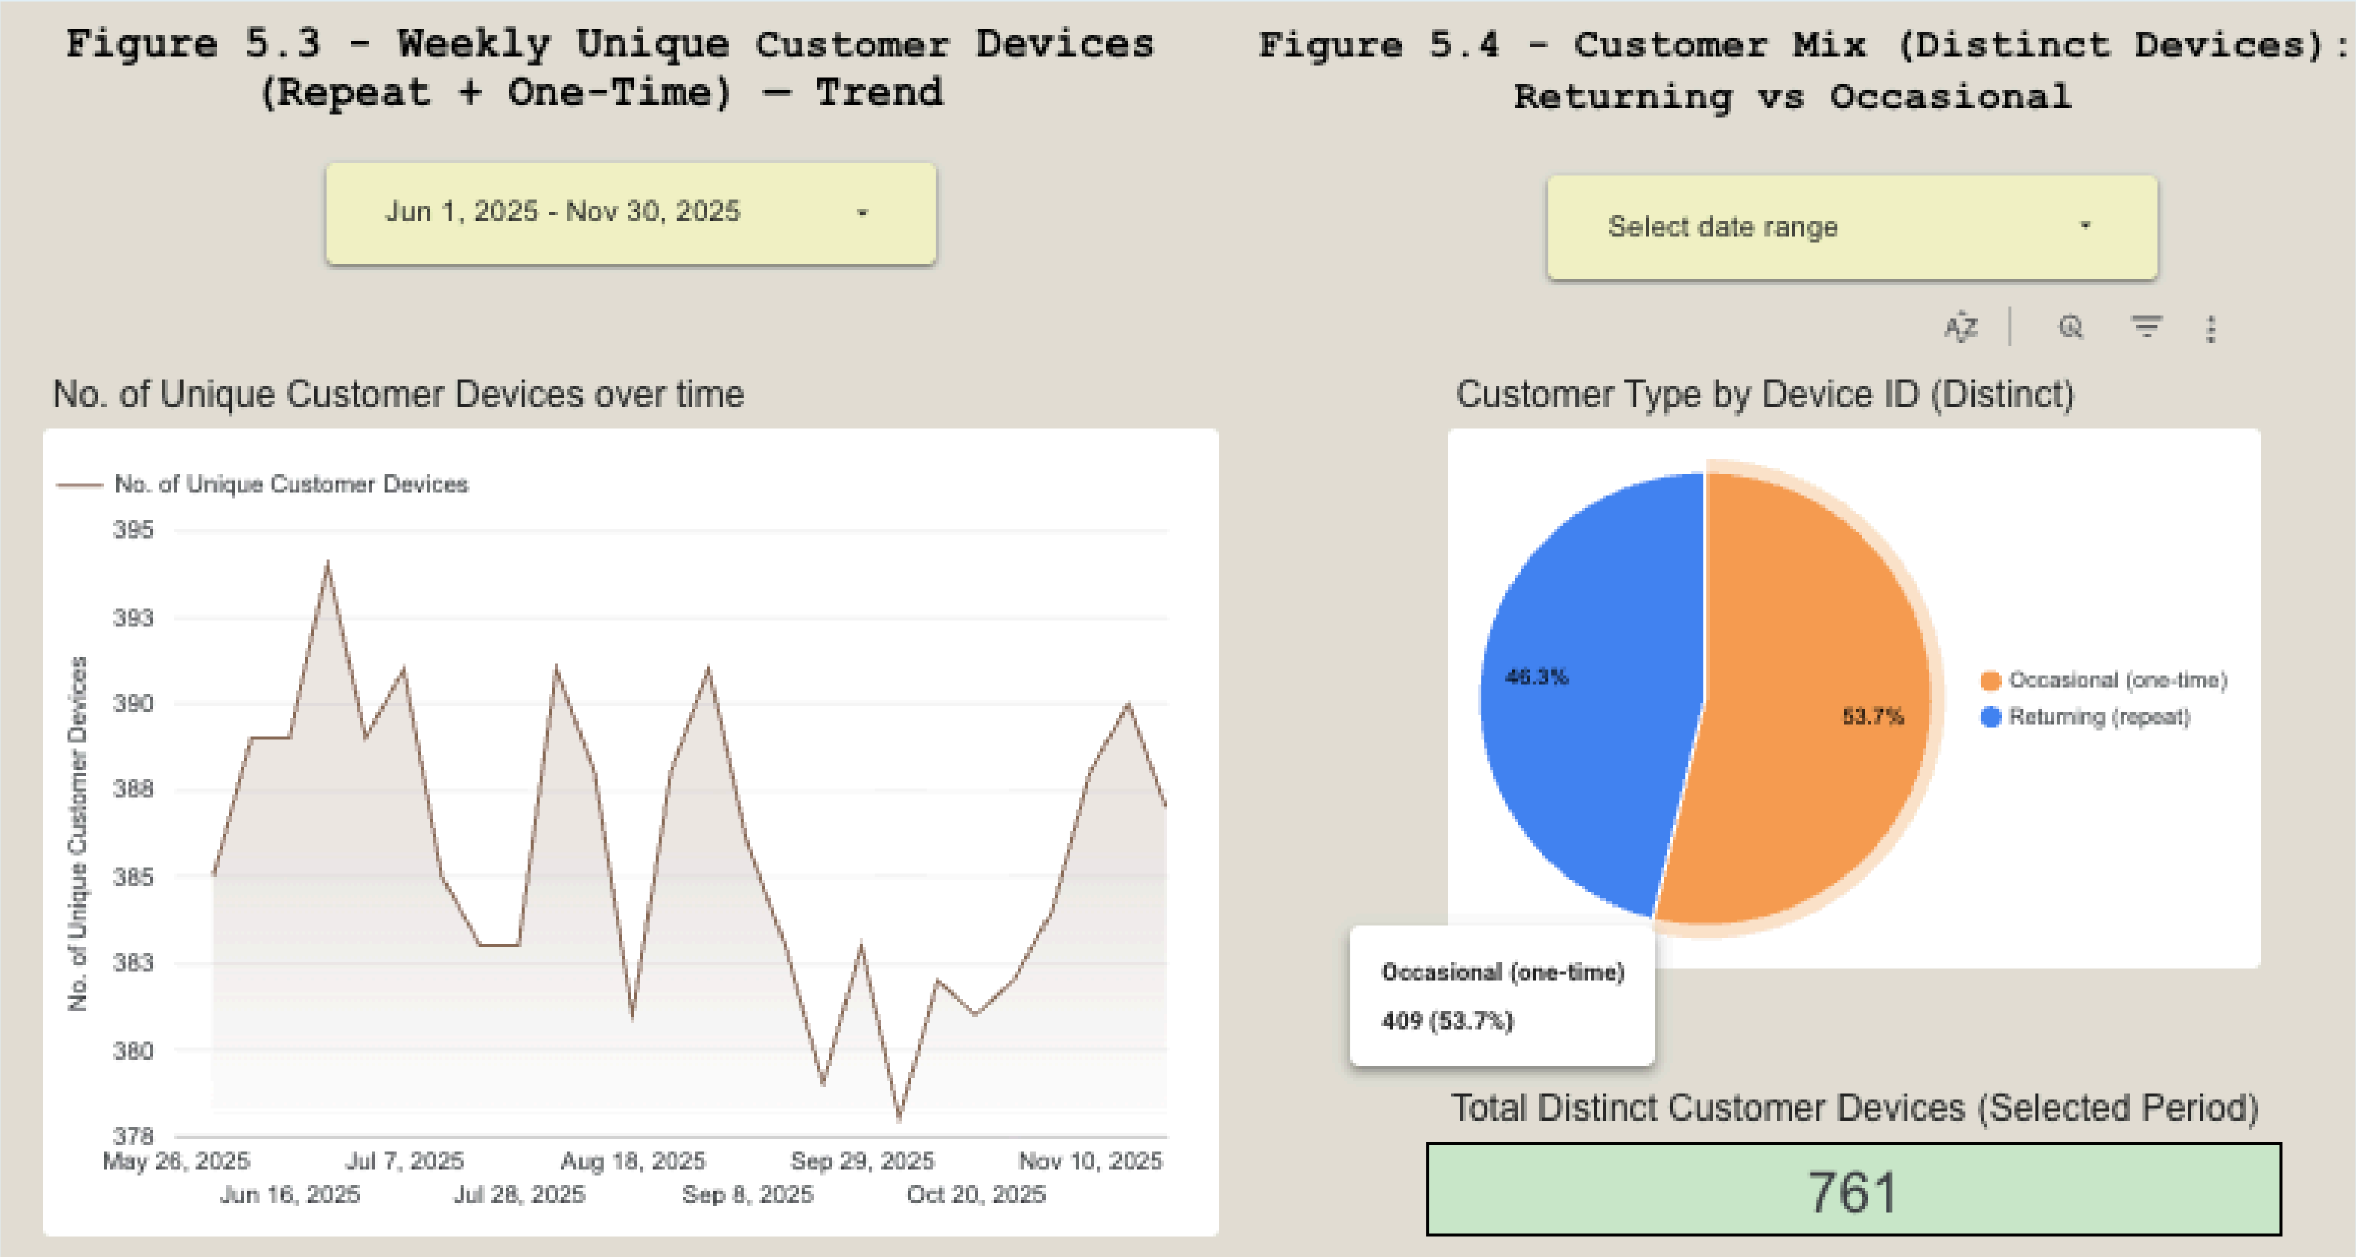
Regression: Longer visits → larger baskets



- **Slope:** +₪7.63 per minute ($p < 0.001$)
- **Fit:** $R^2 = 0.759$ (strong relationship)
- **Interpretation:** Longer visits → higher spend (app customers)

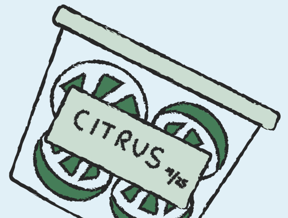
Dashboard (interactive monitoring)





Scan to open dashboard

- Weekly reach is **stable** (no strong up/down trend)
- Total distinct customer devices: **761**
- Mix: **53.7% occasional / 46.3% returning**



Business Recommendations

Staff to peaks: Thu 09–14, 16–19
Fri 09–14

Add checkout capacity: lanes + self-checkout

Grow basket size: increase dwell (app + in-store prompts)
